

WORKED EXAMPLE

Jack Mo reads it aloud

Tower crane & frame

THE UNTRAINED EYE vs THE RISK MANAGER'S EYE

Jack Mo circles what his eye lands on — and the empty sky (no second crane).

To an untrained eye this is almost a postcard — a crane against a bright sky, a building going up, everything under control. A risk manager looks at the same photo and feels their stomach tighten. They don't see a crane; they see the single thread the whole job hangs from.

Look how much leans on that one machine. Every beam the ironworkers set, every form the concrete crews fly, every panel still to come — all of it rides one hook. The casual eye counts one crane and moves on. The trained eye counts one crane and asks the next question: what happens the morning two trades both need it? One of them waits — and on a jobsite, waiting is money leaking out of the schedule.

Keep looking the way a PM looks. Those loads don't teleport; they swing, over the heads of the crew and the street below. A postcard has no danger in it; a risk read sees a suspended load and a person in the same sentence. Follow the crane down to its base, where every lift funnels to one crowded point. Then notice what isn't there at all — a second crane. No backup. One breakdown, one windy afternoon, and the whole job holds its breath.

The scene never changed between those two readings. The eye did. An untrained eye sees objects; a risk manager sees what each object could do, to whom, and when.

THIS SCENE FEEDS YOUR REGISTER

R1 · R35 · R39 · R43 · R47 — the five students dealt the crane scene.

The discipline under that read

The moves you run so you can see it too — then five register rows fall out of one glance.

LOOK sweep overhead → working level → ground → edges → background (don't lock on the crane).

SPLIT say what you SEE — facts only: one crane, one hook, single base, no second crane.

NOTICE circle the 2–3 cues: the single hook, the base everything funnels to, + the missing backup.

ASK → PROJECT what releases it, who's in the path, what happens next — and in which phase.

NAME · five rows, born from one glance (cause → event → consequence)

1 Schedule

Because the site has only one crane and every trade needs it, two crews may need a lift in the same hour, leading to one crew idle and the schedule slipping.

Owner: Superintendent · Trigger: two lift requests for the same hour on the daily crane log.

2 Safety

Because heavy loads swing over the deck, a rigging failure or struck load may occur, leading to a serious injury.

3 Logistics

Because everything funnels to one pick-point, deliveries and lay-down may pile up at the base, leading to congestion and double-handling.

4 Availability

Because there is no backup crane, one breakdown may occur, leading to the whole site stopping.

5 Weather

Because high winds suspend lifting, a windy spell may occur, leading to lost lift days.

READING MOVE · bank this card

“Ask what ONE piece of equipment controls — when one machine serves everyone, that's your first risk.”

SUCCESS CARD · check the read against these six

☐ a real, visible cue ☐ cause is a site condition ☐ a future event ☐ consequence on cost/time/quality/safety

☐ owner + early-warning trigger ☐ (M4) P and I each defended

P × I? Not yet — Module 2 IDENTIFIES the risk; Module 4 ASSESSES it. These rows seed register rows R1 / R35 / R39 / R43 / R47.
