

WORKED EXAMPLE

Jack Mo reads it aloud

Tight urban site

THE UNTRAINED EYE vs THE RISK MANAGER'S EYE

Jack Mo circles what his eye lands on — and the one thing that should be there and isn't.

To an ordinary eye this is just a building going up downtown — walls rising clean to the street, the city humming around it, a job that fits its block. A risk manager looks at the same photo and feels the walls press in. They don't admire the building; they look at its EDGES, and the edges are where the trouble lives. There's almost no open ground: the structure runs to the property line, neighbors stand close enough to touch, and a public sidewalk hugs the front. The casual eye sees a tidy footprint and moves on. The trained eye sees a site with nowhere to put anything, and asks the next question — where does everything GO? The trucks that can't stage block the street, so crews stand idle waiting on materials. The dust, noise and vibration this close don't vanish; they travel into occupied buildings, and a single neighbor complaint can stop the job. The public walks within feet of live work, so safety is never theoretical. And a dense downtown lot draws heavy permitting and strict code review, so approvals arrive late and a failed one can force redesign. The scene never changed between those two readings. The eye did. An ordinary eye sees a building; a risk manager sees a site hemmed in on every side, and reads each edge as a place where the work could escape.

THIS SCENE FEEDS YOUR REGISTER

R2 • R6 • R40 • R44 • R48 — the five students dealt this scene.

The discipline under that read

The moves you run so you can see it too — then five register rows fall out of one glance.

- LOOK

sweep overhead → working level → ground/openings → edges → background (don't lock on the obvious).
- SPLIT

say what you SEE — facts only: The structure runs right up to the property line, leaving almost no open ground inside the fence., A public sidewalk hugs the front of the building, with pedestrians passing within feet of the work., Occupied neighboring buildings stand close on the sides, sharing walls of air with the work zone..
- NOTICE

circle the cues: The property line where the structure meets the street, with no buffer of open ground; The public sidewalk hugging the front, pedestrians passing within feet of live work; The shared faces of the occupied neighbor buildings close on the sides — and the missing There is no lay-down yard, no staging area, no open ground anywhere inside the fence — the one thing every busy site needs, and the one thing this site does not have. Its absence is the whole risk: with nowhere for materials and trucks to GO, they spill into the street and the schedule, and the work pushes outward into the neighbors and the public.
- ASK → PROJECT

what releases it, who's in the path, what happens next — and in which phase.

NAME · five rows, born from one glance (cause → event → consequence)

- 1

Logistics / Productivity

Because the site runs to the property line with no room to stage, delivery trucks may block the street and crews may wait on materials, leading to idle labor and slipping productivity.
Owner: Superintendent · Trigger: A delivery truck idling in the travel lane on the daily delivery log, or a crew logged waiting on materials
- 2

Neighbor Relations

Because the work sits feet from occupied buildings, dust, noise and vibration may reach the neighbors who then complain, leading to a complaint that can halt the job until it is resolved.
- 3

Public Safety

Because the public passes within feet of live work along the front sidewalk, a falling object or street-level incident may strike a passerby, leading to a serious public injury and an immediate stop to operations.
- 4

Permitting

Because a dense downtown lot draws heavy permitting demands, required approvals may arrive late, leading to delayed starts on permit-gated work and a compressed schedule.
- 5

Code Review

Because the site faces strict downtown code review, a submitted design may fail review, leading to forced redesign and rework that pushes the schedule and adds cost.

READING MOVE · bank this card

“When a site is hemmed in, ask where does everything GO — the materials, the trucks, the dust, the people. Whatever has nowhere to go is your first risk.”

SUCCESS CARD · check the read against these six

- ☐ a real, visible cue

☐ cause is a site condition

☐ a future event

☐ consequence on cost/time/quality/safety
- ☐ owner + early-warning trigger

☐ (M4) P and I each defended
